An Ambient Agentic AI for Multi-App Travel

8 Designers Timeline: 22 hours Role: Interaction Designer

Brief

Samsung tasked teams to move beyond isolated chatbots and envision an OS-level agentic AI for the Galaxy ecosystem

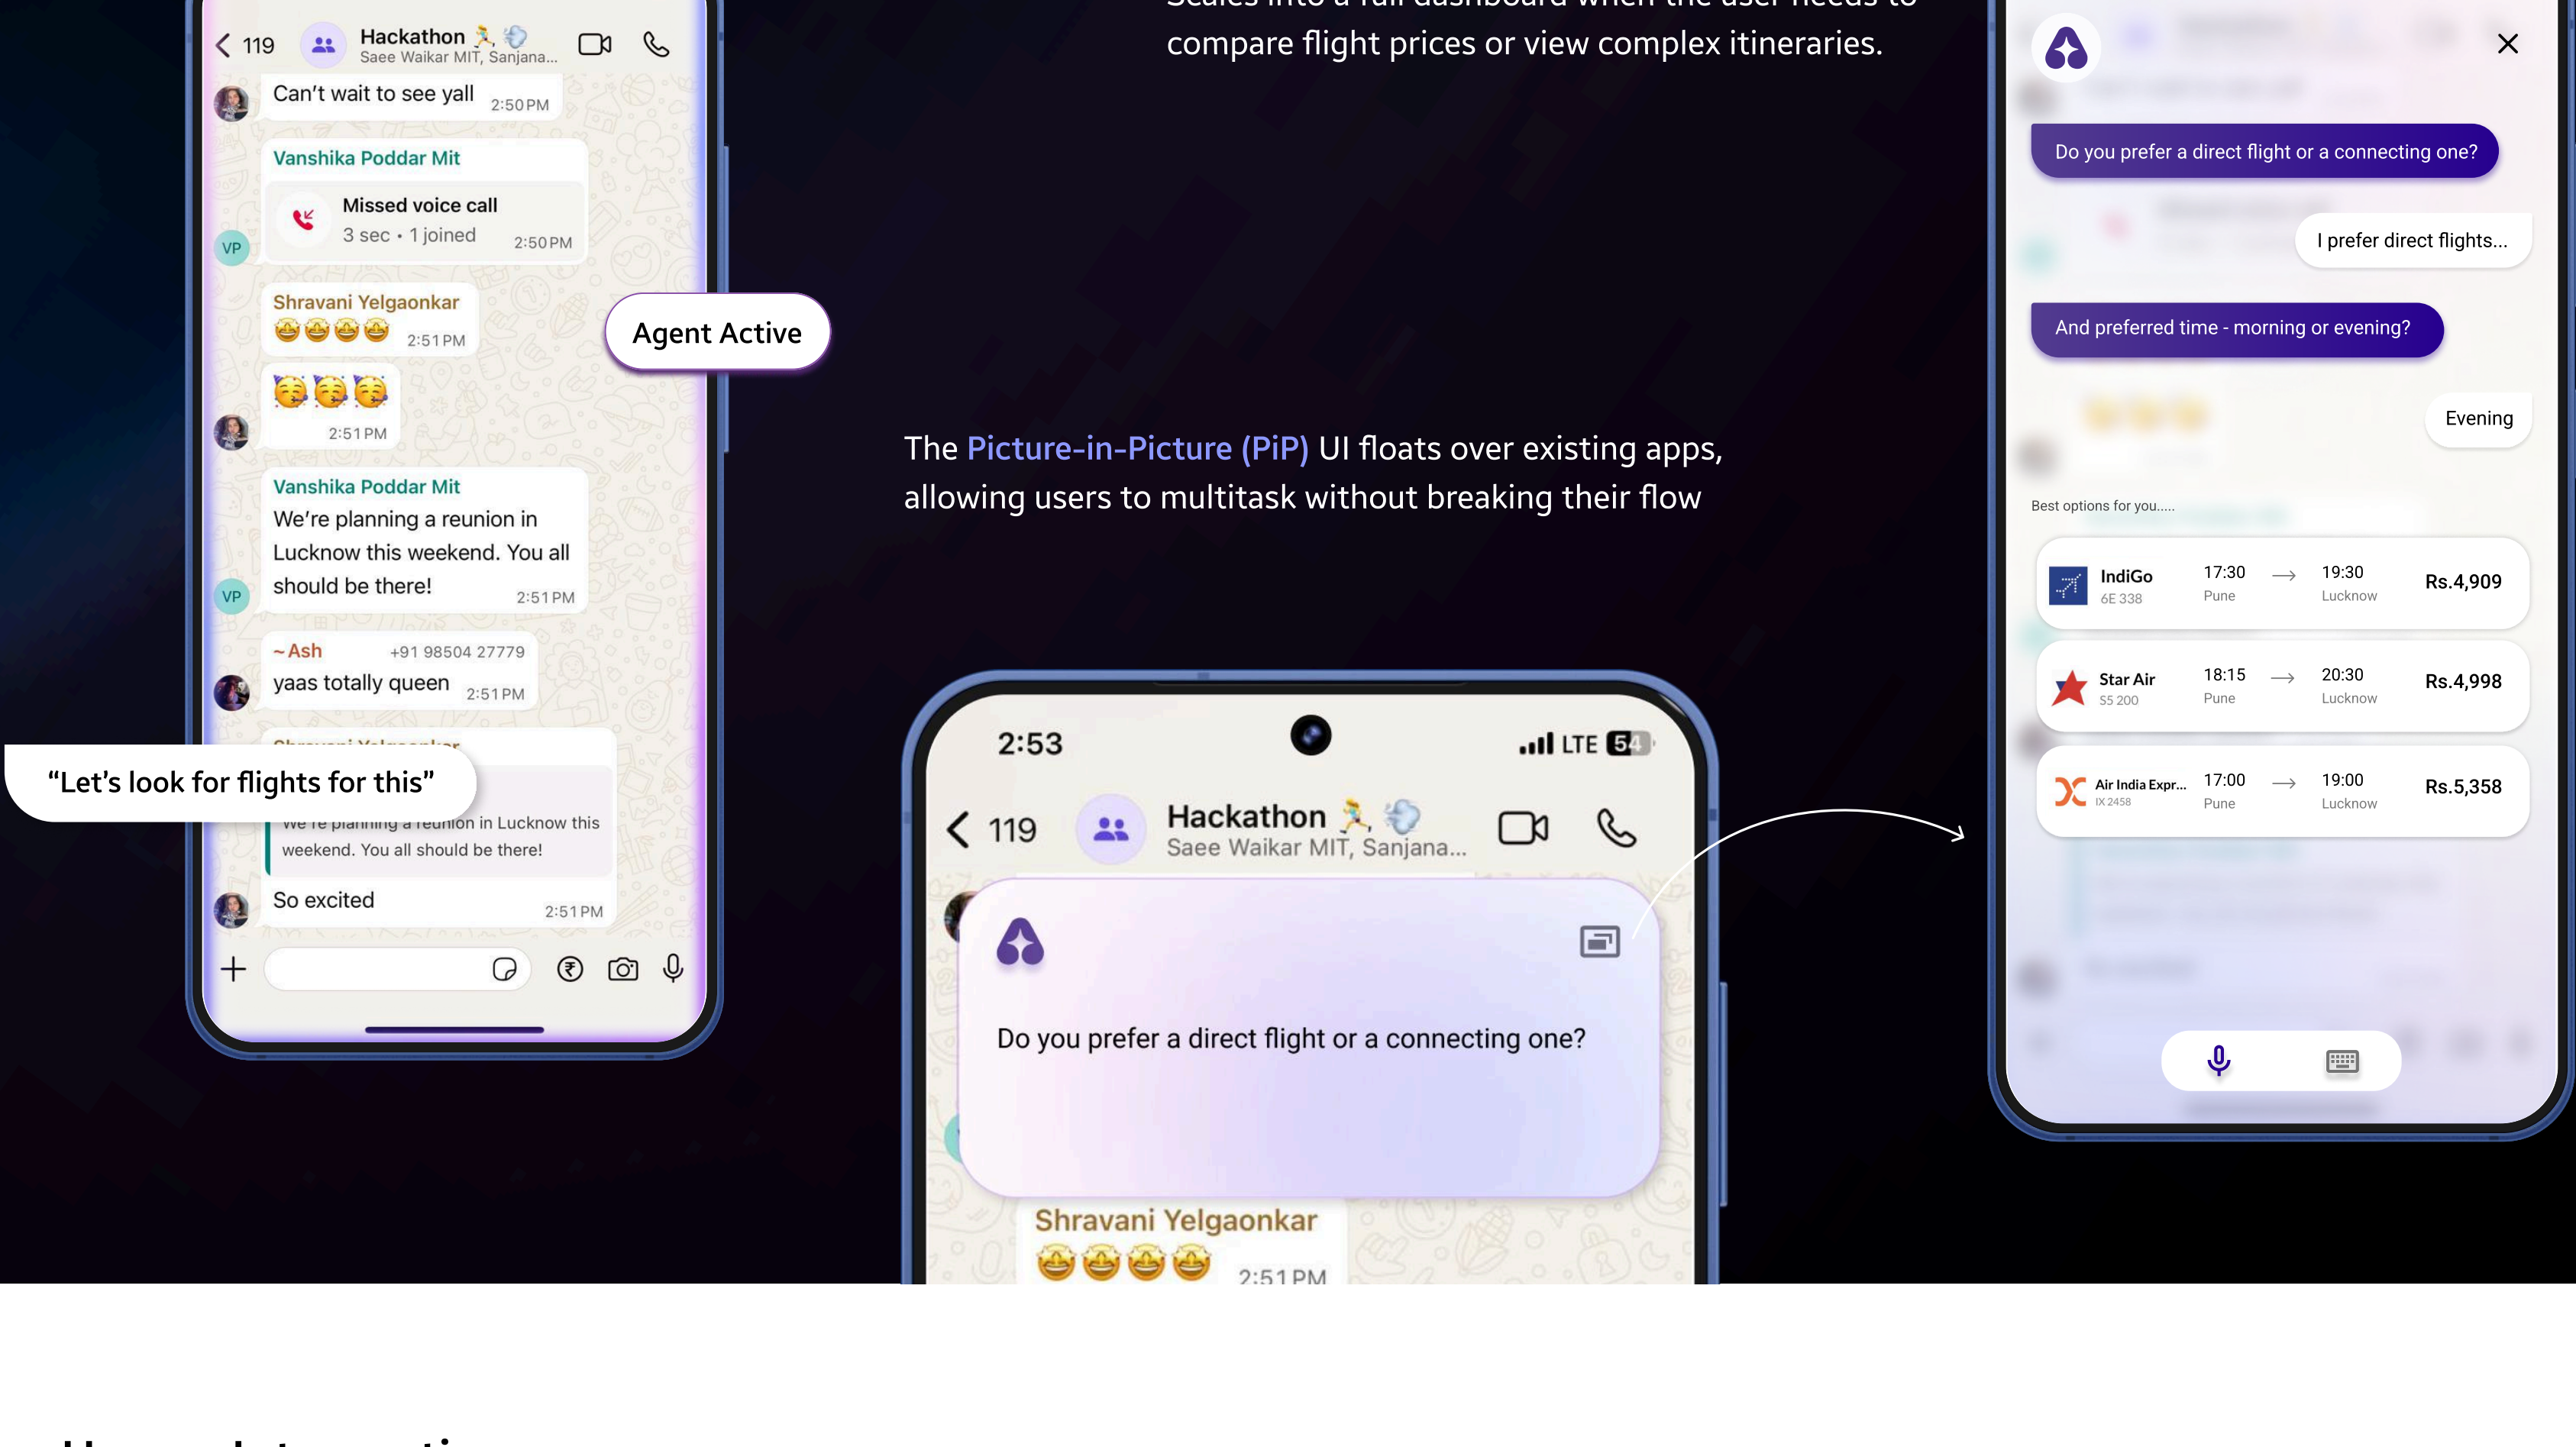

5 Touchpoints

- ✦ Flight search & booking
- ✦ Smart fridge recipe suggestion
- ✦ Contextual memory
- ✦ Multi-app logistics
- ✦ Multimodal AR search

Key considerations while envisioning the agent

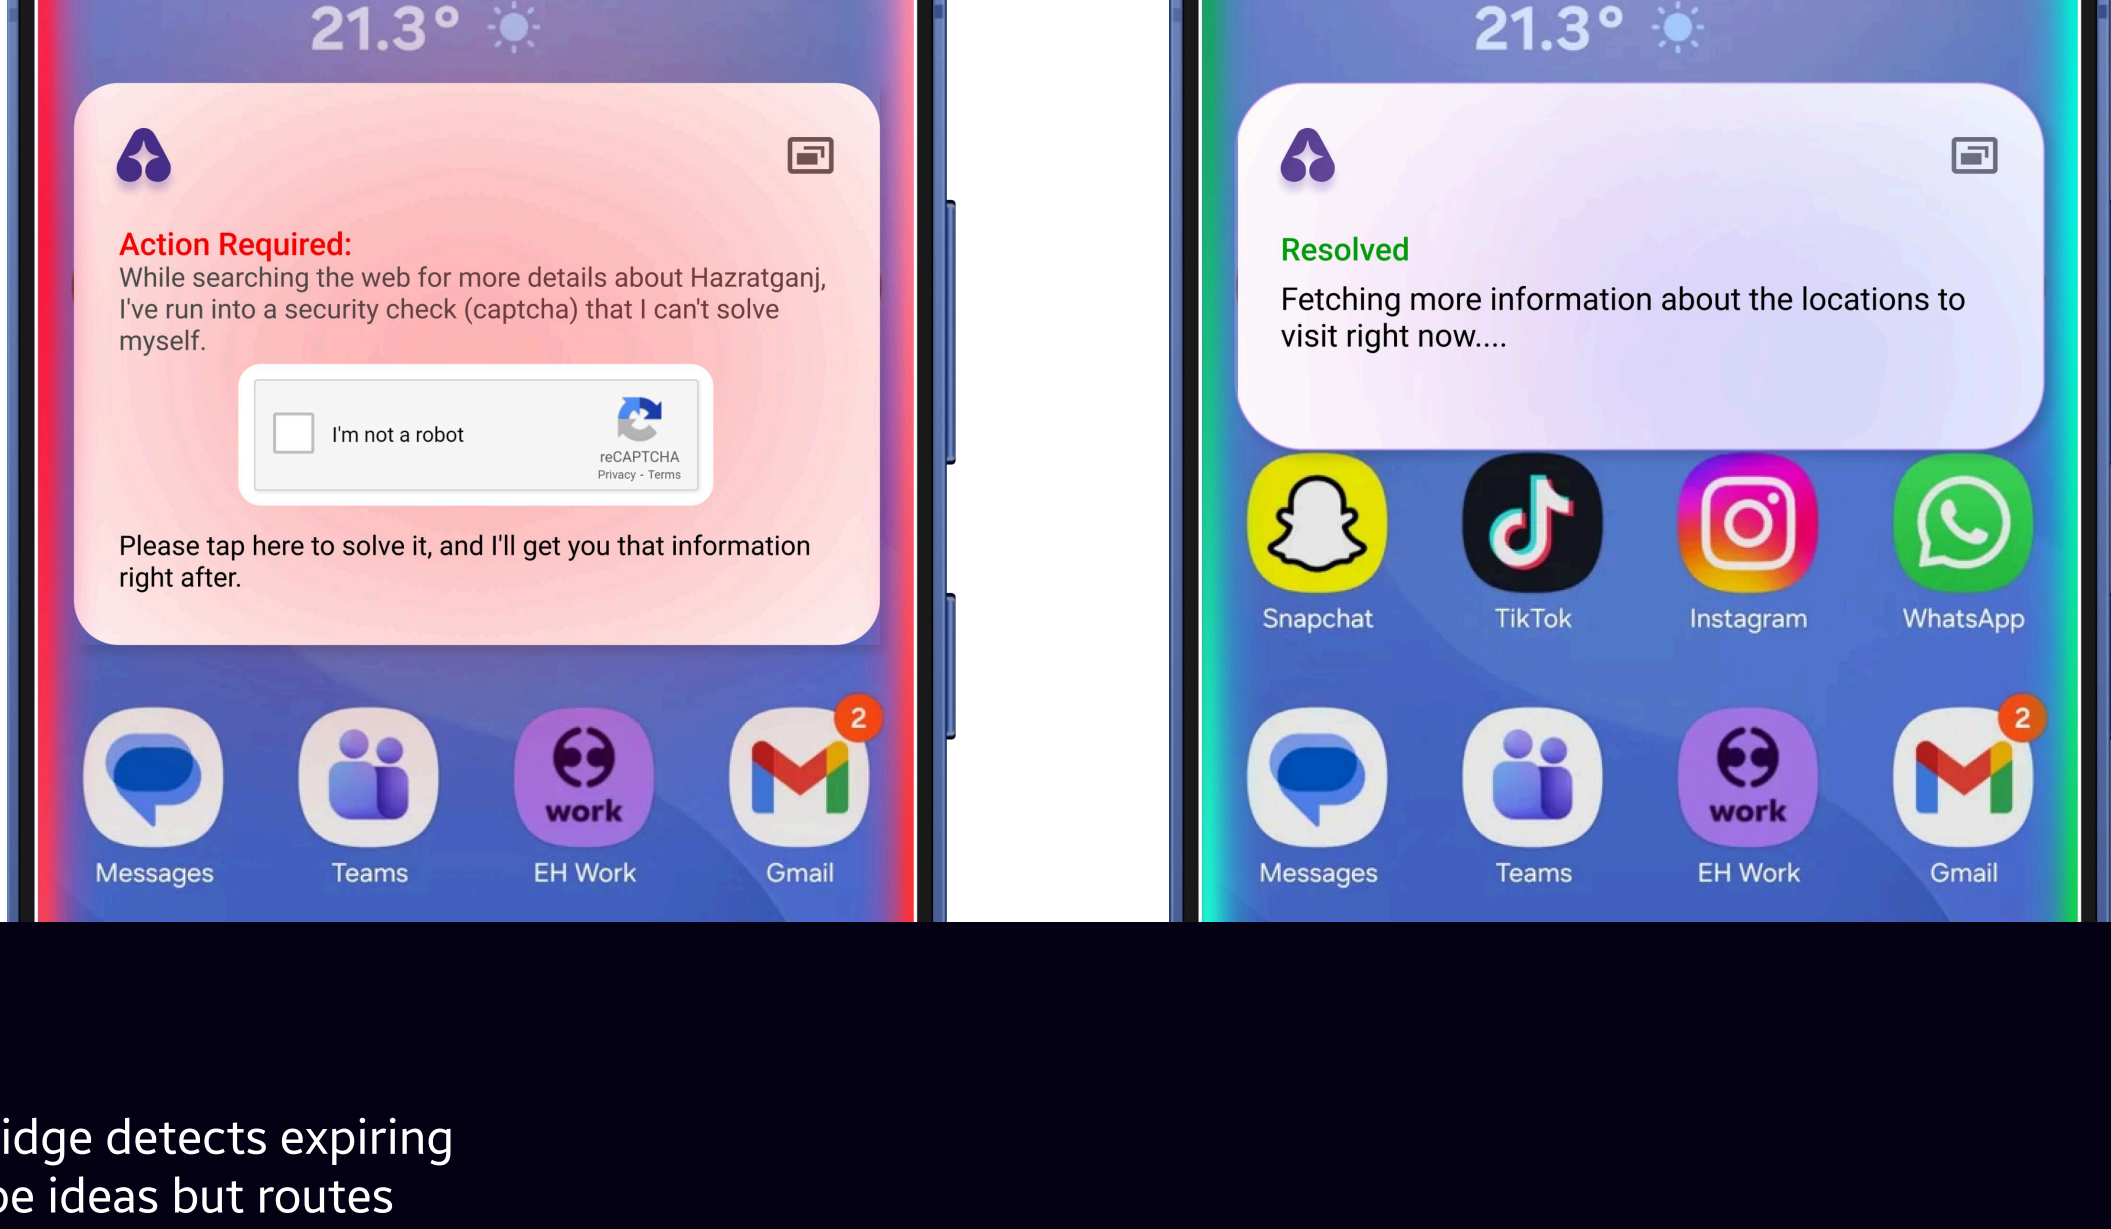

- ✦ Intent articulation from conversation without manual input.
- ✦ Allows planning & booking without disrupting the ongoing chat.
- ✦ Enables actions instantly without switching apps.
- ✦ Shows decision-making process to maintain transparency & user control.
- ✦ Adjusts interface size & detail based on user needs.

Social Context Awareness

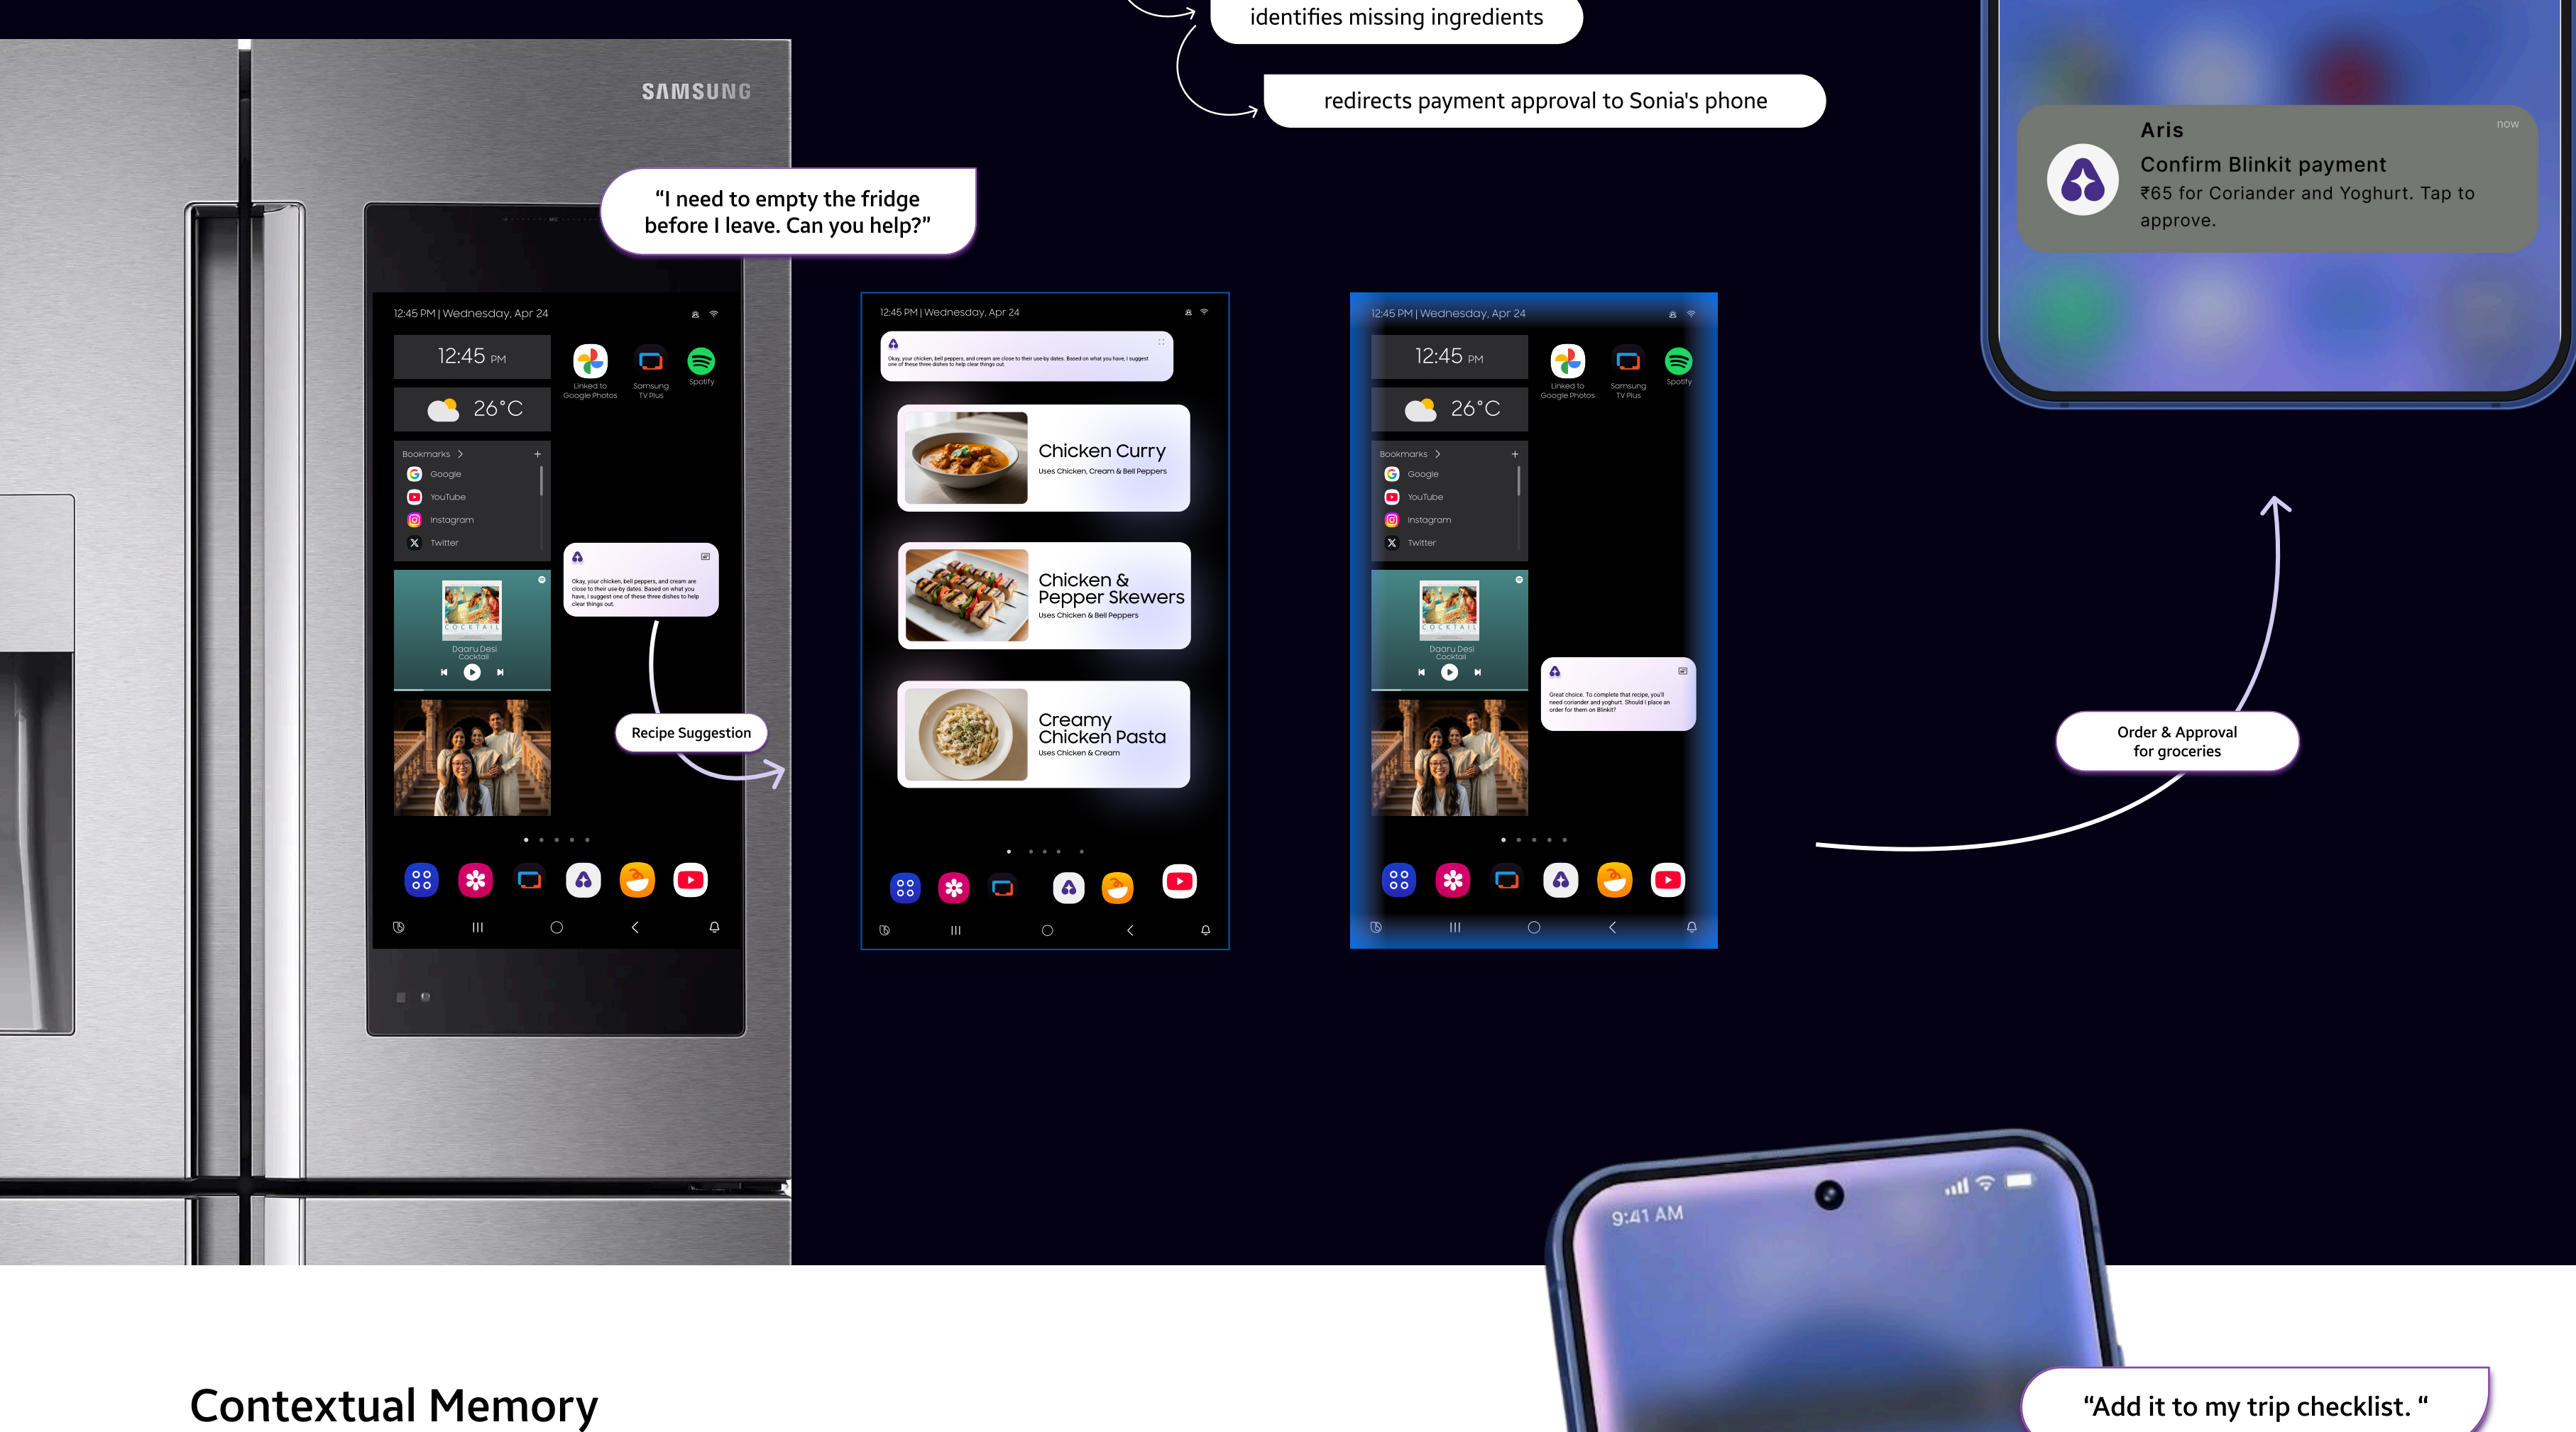

Human Intervention

- AI agents break when they hit security barriers, logins, or bot-detectors.
- Pauses at security checks for quick user verification, then resumes background tasks instantly.

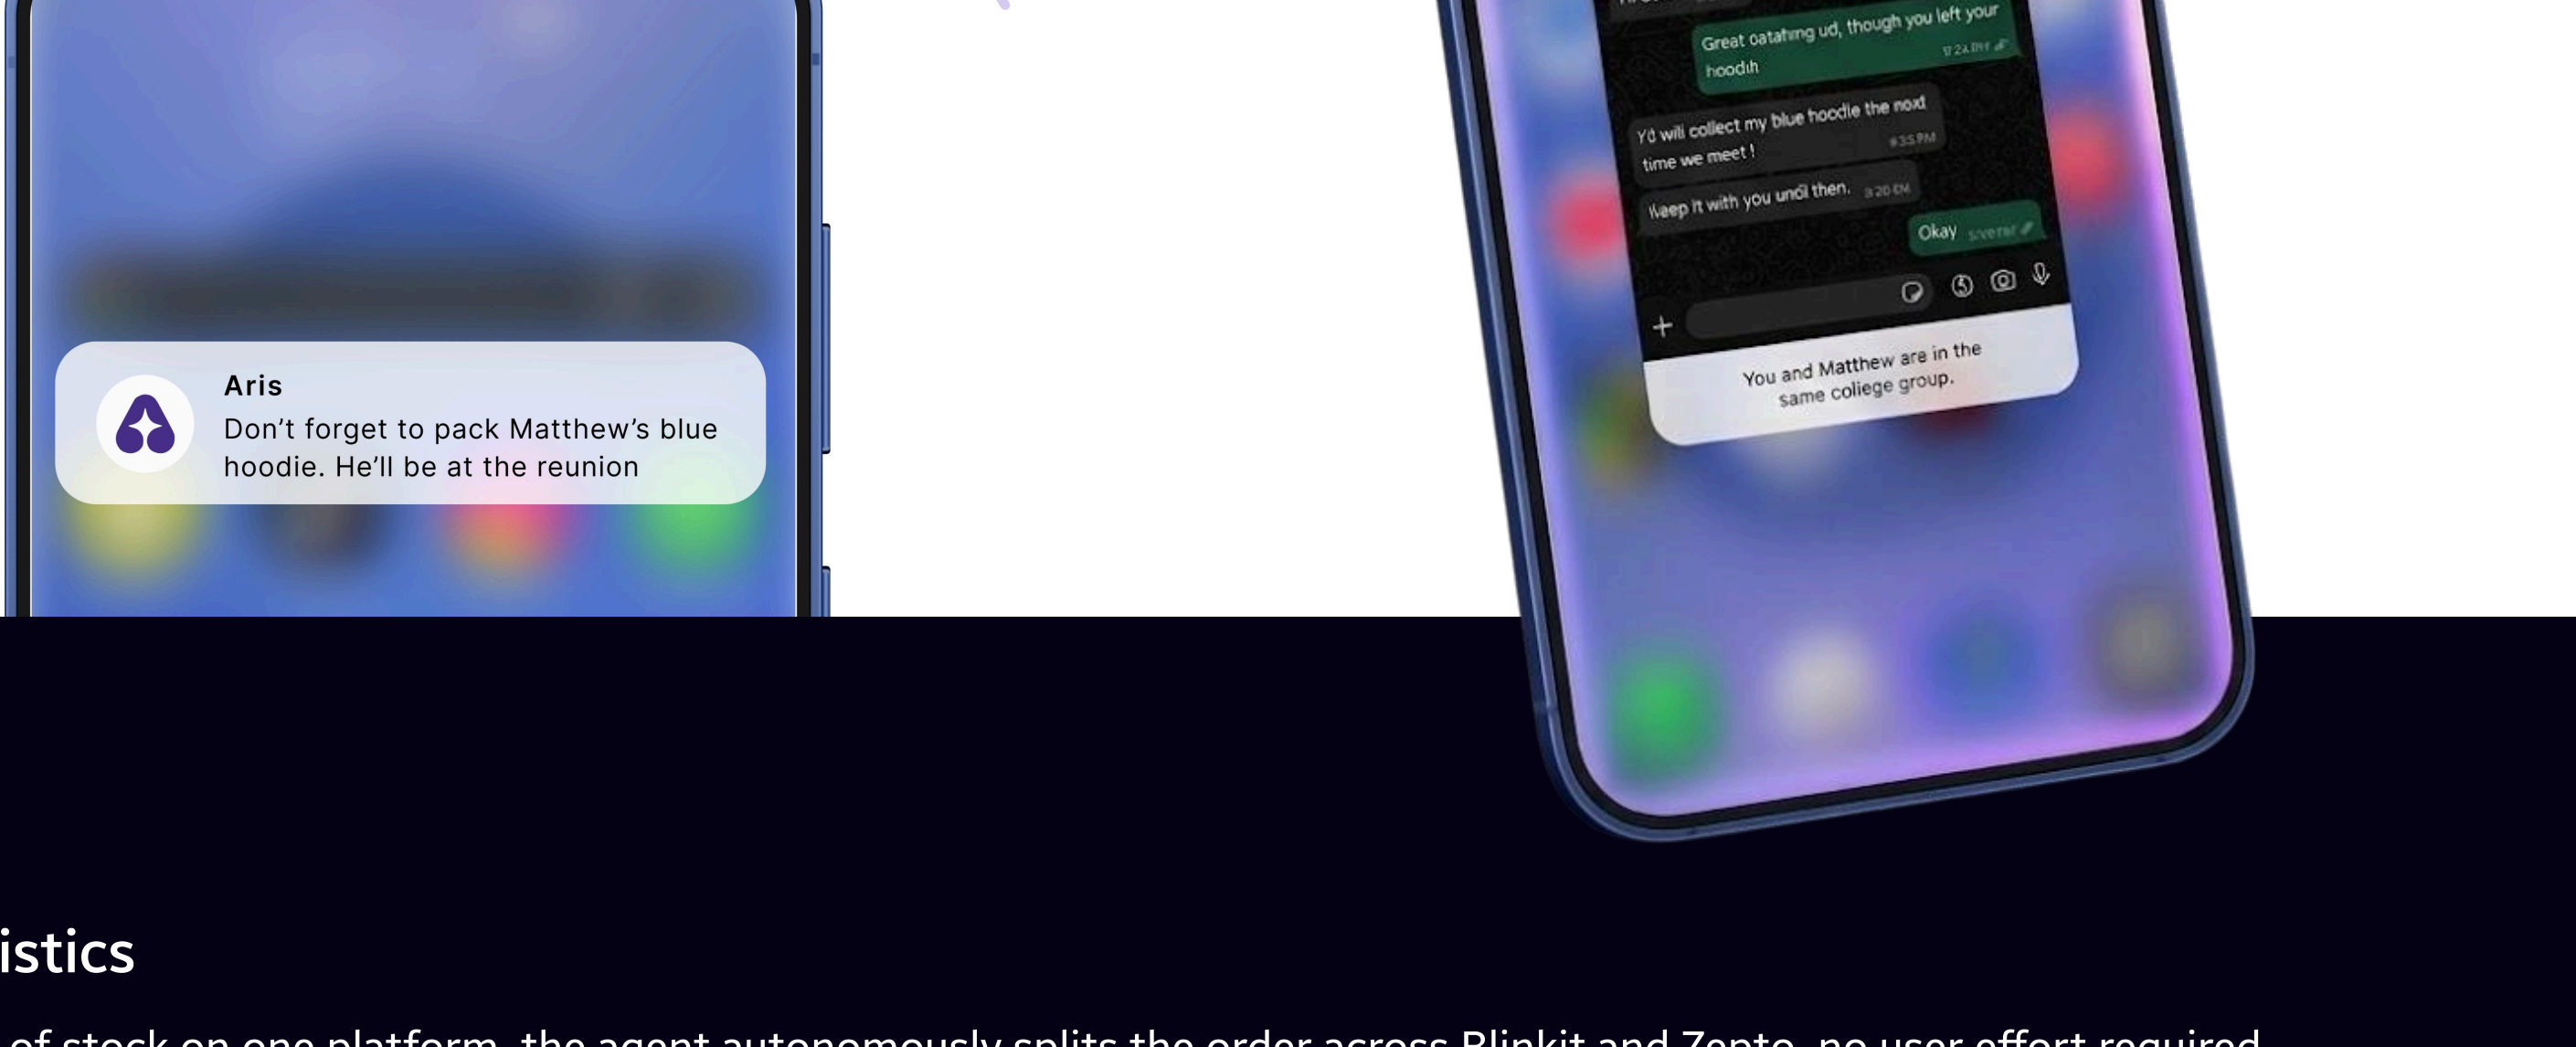

The Samsung Family Hub fridge detects expiring ingredients, generates recipe ideas but routes payment approval to the user's mobile device to make a payment.

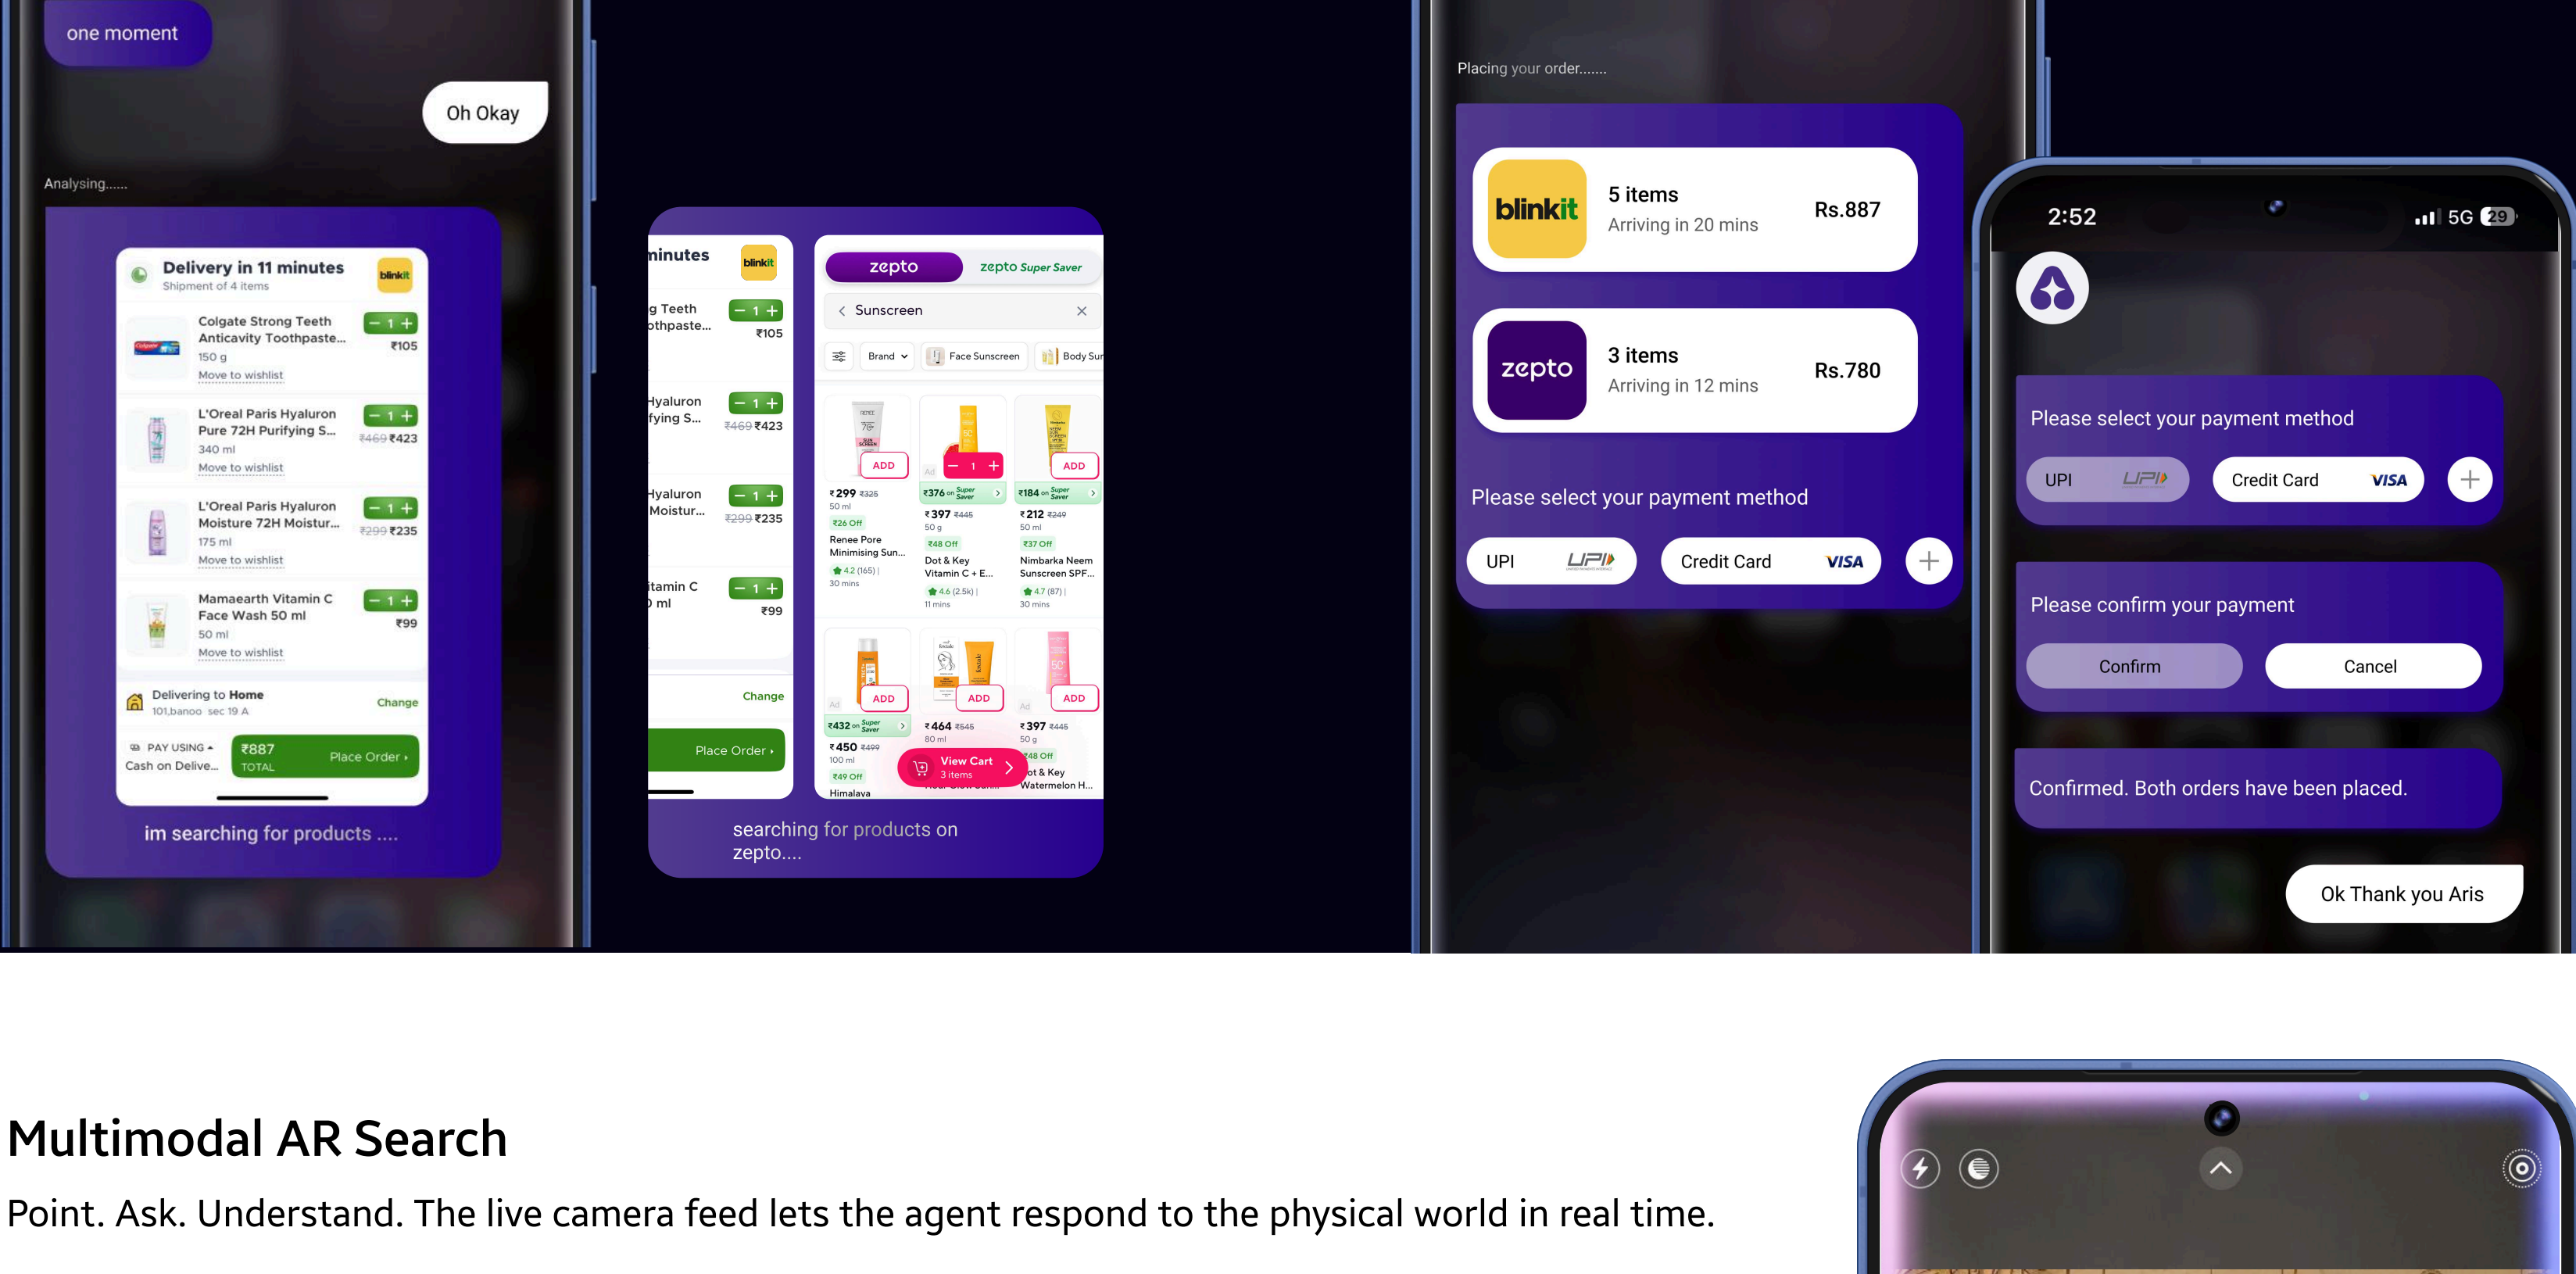

Contextual Memory

The agent connects dots across past conversations to surface relevant reminders before the user even thinks to ask.

Multi-App Logistics

When items are out of stock on one platform, the agent autonomously splits the order across Blinkit and Zepto, no user effort required.

Multimodal AR Search

Point. Ask. Understand. The live camera feed lets the agent respond to the physical world in real time.
